CROPS AND LIVESTOCK SERIES NO. 48

Preface

This publication is designed to revise and bring up to date the information contained in Prices Received by South Carolina Farmers, 1910-1955, South Carolina Agricultural Experiment Station, Bulletin #439, published in May 1956.

The monthly prices received by South Carolina farmers reported herein are for the years 1952 through 1965. Any price revisions made during the 1952-65 period are shown without reference to revisions.

The indexes reported herein are also for years 1952 through 1965, inclusive. Beginning with December 1952 the index numbers utilize a weight base period of 1959-63 in order to reflect changing production patterns. Construction of the index is comparable to the U. S. Index of Prices Received by Farmers published by the United States Department of Agriculture.

For this project State funds are matched with Federal funds received from the Consumer and Marketing Service, United States Department of Agriculture, under provisions of the Agricultural Marketing Act of 1946.

Acknowledgement

Thanks and special acknowledgement is extended to the thousands of voluntary crop, livestock and price reporters of South Carolina. They have served their state and nation and thereby themselves and Agriculture for over a half-century with no reward except the satisfaction of participating in a needed service and the information provided to them by the South Carolina Crop Reporting Service.

Appreciation is also expressed to the Price Statistics Branch, Agricultural Estimates Division, Statistical Reporting Service, United States Department of Agriculture, for their assistance in the work of revising the index. To Larry E. Snipes, Agricultural Statistician in South Carolina who has transferred to the Washington, D. C. office since completing most of the revisions and to James R. Moeller, Agricultural Statistician for completion of the revisions and preparation of this manuscript.

Much credit is due the clerical staff for many hours of effort in computations and typing.

Introduction

Larry E. Snipes and James R. Moeller, Agricultural Statisticians

This bulletin is divided into two parts. Part I presents an explanation of the method used in deriving the index numbers. Also contained in Part I are the index numbers by months and the simple yearly (annual) average of the 12 monthly indexes for the years 1952 through 1965.

The patterns of production and marketing of agricultural commodities by South Carolina farmers are constantly changing. Therefore, it is difficult to evaluate economic changes without some kind of measure. Such is the function served by a price index. To reflect these changes with a price index, the weights used to combine prices into the index must be updated from time to time if the indexes are to be representative of South Carolina's agriculture.

The last major revision of South Carolina's price indexes was published in May 1956. In the 1956 revision, three time periods, each with a separate set of weights, were delineated. Weights for the years 1924-1929 were used to represent the period January 1910 through June 1935, 1937-1941 for the period June 1935 through January 1946, and 1947-1951 for the period January 1946 through December 1952.

The current revision terminates the third time period in December 1952 and begins the fourth or present period. The present revision incorporates a new set of weights obtained from the average quantity and value of each commodity marketed during the period 1959-1963 and is used from December 1952 to date. All of the indexes are linked to the 1910-14 base period which equals 100.

Part II of this bulletin presents monthly prices received by South Carolina farmers by months for the period 1952 through 1965. The 1965 prices are preliminary and subject to revision. The monthly agricultural prices received are based largely on data supplied by voluntary price reporters from throughout the State. The reporters submit reliable information relative to the level of prices prevailing in their communities about the middle of each month for the items with which they are familiar. The reported prices should not be assumed to represent prices a given producer received for his products at a given market. The most important uses of these price estimates are (1) to provide current price information which can be combined with production and sales estimates to compute cash and gross farm income estimates, (2) to provide a basis for computing index numbers which show the comparative changes in prices of individual commodities or groups of commodities, (3) to provide a historical record of prices, and (4) to contribute in the establishment of national prices and parity ratios.

Season average prices are monthly prices weighted by the monthly volume of each commodity sold during the marketing season or crop year and are not necessarily calendar year averages. Season average prices are shown for all crops. Annual average prices are shown for all livestock and livestock products and are the monthly prices weighted by monthly volume of sales on a calendar year basis. Only season average prices are shown in this publication for fruits, nuts, and commercial vegetables while both monthly and season or annual averages are shown for all other commodities.

PART I

Index Numbers of Prices Received by South Carolina Farmers

The Index of Prices Received by Farmers is a measure of trend and changes in prices received by South Carolina farmers for agricultural commodities sold. Index numbers have come to be accepted as the most convenient statistical device for measuring price trends and making comparisons of prices of farm products.

In general, the All Commodity Index combines the prices of individual farm products into a single figure which enables prices for any month or year to be compared with prices during the base period 1910-14. The use of a common base period (1910-14) facilitates the comparison of the trend in prices received by South Carolina farmers with the trend of prices received by farmers the country over. A series of index numbers shows the trend of prices received for the months or years in the series. Index numbers make possible the comparison of price changes for specified groups of commodities even though the price within the group is quoted for different units of measure. For example, price changes for grains which are quoted in dollars per bushel may be compared with price changes in meat animals which are quoted in dollars per hundredweight. Also, some products are much more important than others in a particular group. In the case of the poultry and egg group, for example, the index combines prices of chickens, turkeys, and eggs according to the relative importance of each in South Carolina. Likewise, each group of commodities is represented in the overall index according to its relative importance.

The South Carolina index is of the aggregative type, in which prices for a specific period are weighted by quantities sold in the weight base period. This procedure converts each commodity into an aggregate which can be combined in order to compute a group index.

Recent Trends and Effect of Revisions on the Index

Since the previous revision in 1956, significant changes in production, disposition, and value of sales of individual commodities have occurred in South Carolina. The present revision to the 1959-63 weight base period brings the index up to date by assigning to each commodity a relative importance based on cash receipts during this period. The relative importance in the index for each of the major groups and subgroups of South Carolina's agricultural commodities is depicted graphically in Figure 2 for the previous base period (1947-51) and in Figure 1 for the new weight base period (1959-63). Livestock and livestock products have increased in relative importance from 22.4 percent on the old basis to 29.2 percent on the new basis. This is due to an increase in relative importance for each of the livestock subgroups. The greatest change is in the poultry and eggs subgroup which increased from 7.4 percent to 11.5 percent. An increase in egg production and sales accounted for a large proportion of this increase.

The dairy products subgroup increased from 4.9 percent to 6.9 percent and meat animals increased slightly to 10.9 percent of all commodities. Within the meat animals subgroup, hogs declined in importance but this decrease was more than compensated by increases for both beef cattle and calves.

The all crops group declined from 77.6 percent to 70.8 percent in importance relative to all commodities from the 1947-51 weight base period to the new weight base period. This does not necessarily mean that cash receipts for the crops group decreased, but that cash receipts from livestock and livestock products now represent a larger percentage of total cash receipts. Within the all crops group the most significant decline in relative importance was for cotton lint. Cotton lint is down to 20.0 percent from 36.4 percent in the old weight base period. Commercial vegetables declined slightly in importance, from 4.8 percent to 4.7 percent. The grain group was down to 4.7 percent from 5.0 percent.

Significant increases in cash receipts and in relative importance were registered for the Oil Bearing commodity group. The increase from 5.5 percent to 8.7 percent was due entirely to the big increase in soybeans -- more than offsetting declines for cottonseed and peanuts. Tobacco increased from 23.6 to 28.1 percent and now carries more weight than for any other individual crop or commodity subgroup. Returns from tobacco was nearly equal to that from all livestock and livestock products during the weight base period 1959-63. The fruits and nuts commodity subgroup also registered a sharp increase -- up to 4.7 percent compared with 2.2 percent in the 1947-51 weight base period. Increased value of sales occurred for peaches, grapes and pecans.

Table 1 -- INDEX OF PRICES RECEIVED BY SOUTH CAROLINA FARMERS: Relative Importance of Groups and Subgroups in the Index during Weight Base Periods 1924-1929, 1937-1941, 1947-1951 and 1959-1963.

Group	1924-1929 Relative Importance		1937-1941 Relative Importance		1947-1951 Relative Importance		1959-1963 Relative Importance	
	Within group	Total	Within group	Total	Within group	Total	Within group	Total
----- Percent -----								
All commodities		100.00		100.00		100.00		100.00
Crops	100.00	87.40	100.00	82.10	100.00	77.60	100.00	70.77
Food grains	.30		1.50		1.80		(6.64	<u>1/</u>
Feed grains and hay	2.30		4.10		4.70		(
Oil bearing	7.30		7.30		7.10		12.25	
Cotton	69.60		50.60		46.90		28.19	
Tobacco	11.00		24.00		30.40		39.66	
Commercial vegetables	8.60		9.20		6.20		6.66	
Fruits and nuts	.90		3.30		2.90		6.60	
Livestock and livestock products	100.00	12.60	100.00	17.90	100.00	22.40	100.00	29.23
Meat animals	33.09		39.89		45.22		37.19	
Dairy products	32.94		35.31		21.79		23.54	
Poultry and eggs	33.97		24.80		32.99		39.27	

1/ The new subgroup "Grains" replaces Food grains, and Feed grains and hay in previous index computations.

The relative importance of individual or a group of commodities, although based on cash receipts, is dependent on both the average price and quantity sold during the base period. For example, an increased volume of marketings of a commodity accompanied by a lower price might result in little if any change in cash receipts from one base period to another. Such has been the case for several South Carolina commodities since the previous index revision.

Commodity Coverage and Relative Importance

A total of 24 crop and livestock commodities constituting almost 94 percent of the cash receipts by South Carolina farmers for products they sell is included in the revised Index of Prices Received by South Carolina Farmers for the 1959-63 weight base period. There are 17 items in the All Crops Index and 7 items in the Livestock and Livestock Products Index. The commodities in the index and their relative importance in the 1947-51 and 1959-63 weight base periods are shown in Table 2.

Crops are divided into 6 subgroup indexes and Livestock and Livestock Products into 3 subgroup indexes as follows:

A. CROPS

1. Grains
2. Cotton
3. Tobacco
4. Oil Bearing Crops
5. Fruits and Nuts
6. Commercial Vegetables

B. LIVESTOCK AND LIVESTOCK PRODUCTS

1. Meat Animals
2. Dairy Products
3. Poultry and Eggs

Beets06	<u>2/</u>			

1/ Food Grains and Feed Grains and Hay prior to December 1952.

2/ Deleted from the index beginning in December 1952.

Computational Procedures

To attain the proportional weight in the index for each individual commodity within its respective subgroup, a monthly aggregate value was computed by multiplying the price of each commodity by the average quantity sold during the base period. This procedure converts each commodity into an aggregate which can be combined with aggregates for other commodities in the subgroup in order to compute an index for each subgroup. Table 3 gives the quantity sales weights used for each commodity during the 1959-63 weight base period and comparable data for the 1947-51 weight base period.

The 1959-63 = 100 monthly index for each commodity subgroup was obtained by first computing a weight base aggregate which was the average aggregate for the 60 months in the 1959-63 weight base period. This base aggregate was divided into each monthly commodity subgroup aggregate to obtain the index number for the respective commodity subgroup on the 1959-63 = 100 level.

For tobacco, cotton lint, and dairy products, this procedure was not required since each of these commodities represent a subgroup. The index for these three commodities can be obtained by simply dividing the current monthly price by the average price during the 1910-14 base period.

The all crops, livestock and livestock products, and all commodities indexes (1959-63 = 100) are derived by combining the various commodity subgroup indexes into an all crops index and livestock and livestock products index. These are then combined into the all commodities index. This is accomplished by the use of weights obtained from the annual average cash receipts for the weight base period as shown in Table 1.

At this point, the index numbers since December 1952 have 1959-63 as the base period. It is necessary to change these index numbers to a common base period if a continuous series is to be obtained. The common base period for the National agricultural price series and for the South Carolina series is 1910-14.

The procedure for establishing a link between the 1959-63 = 100 indexes and the 1910-14 base involves the selection of a link period or month. For this revision December 1952 was selected as the most appropriate link month because the various subgroup indexes within each group had a fairly normal relationship to each other. On the 1910-14 base, there was a difference of only three points between the all crops and the all livestock and livestock products index for this particular month.

LINKING THE INDEX BACK TO 1910-14 = 100 BASE PERIOD

A conversion factor was computed for each subgroup, group, and all commodities index to convert to the 1910-14 base period. The price index for an individual group for December 1952 was determined first using 1947-51 = 100 and second using 1959-63 = 100. The ratio of the first index number to the second index number was the conversion factor which would change the 1959-63 based index number to the 1947-51 base period. This conversion factor was then multiplied by the conversion factor for changing 1947-51 based index numbers to the 1910-14 base period. The conversion factors for the various groups are included in the table below.

Link Month Indexes for December 1952 and Conversion Factors for 1959-1963 and 1947-1951
Based Index Numbers, South Carolina

	Dec. 1952 Index		Factor for Converting Bases		
	1947-51 = 100 base	1959-63 = 100 base	From 1959-63 = 100 to 1947-51 = 100	From 1947-51 = 100 to 1910-14 = 100	From 1959-63 = 100 to 1910-14 = 100
All Commodities	98.2	107.64	.91230	2.7198	2.4813
Crops	98.0	97.56	1.0045	2.7336	2.7459
Grains	103.3	128.94	.80115	1.8595	1.4897
Cotton	93.3	98.46	.94759	<u>1/</u>	<u>1/</u>
Tobacco	97.9	76.65	1.2772	<u>1/</u>	<u>1/</u>
Oil Bearing Crops	90.7	122.70	.73920	2.7504	2.0331
Fruits and Nuts	95.5	114.45	.83443	2.2196	1.8521
Commercial Vegetables	138.3	123.95	1.1158	1.7458	1.9480
All Livestock	98.8	132.06	.74814	2.6794	2.0046
Meat Animals	85.5	101.16	.84520	3.3895	2.8648
Dairy Products	112.7	118.88	.94801	2.3467	<u>1/</u>
Poultry and Eggs	107.9	169.22	.63763	2.4424	1.5573

1/ No factor is used, since only one commodity is in the subgroup. The index is obtained by dividing the monthly price by the average price during the 1910-14 base period.

Introducing Items into and Deleting Items from the Index

The link date generally is the most favorable time for introducing an item into (or deleting an item from) an index although it can be done at any time. However, in this index revision no items have been introduced. A total of 14 items have been deleted from the index. Items have been considered for exclusion from the index when cash receipts for the item are less than 1/2 of 1% of its major group (Crops or Livestock) during the 1959-63 weight base period. However, on vegetables 1/4 of 1% of all crops has been used as the basis for exclusion. Use of the above limits has led to the deletion of items such as cowpeas, hay, lima beans, cantaloups, lettuce, butterfat, and retail milk. Seasonal groups for a vegetable were treated as separate index items prior to this index revision but are now combined into one index item. An example is spring and fall cabbage which were separate index items but are now combined under fresh cabbage.

Two of the subgroups have been combined into one thus reducing the number of commodity groups under Crops to six. Food grains, and feed grains and hay have been combined into Grains. This was done because food grains was considered to have insufficient importance as a percent of all crops to be continued as a separate subgroup. Weights from the 1947-51 weight base period were used to get a combined 1910-14 = 100 index for December 1952. The December 1952 grains index on a 1959-63 = 100 base was linked to this combined index for conversion to a 1910-14 = 100 base. Computations are shown below for combining the food grains and feed grains and hay indexes:

Index	1947-51 Weights	December 1952 Index 1910-14 = 100
Food Grains	1.8	168.1
Feed Grains and Hay	4.7	201.3
Combined Grains and Hay	6.5	192.1
